

**Subject:** Revised Access Requirements for SAP Business One SQL Database Analytics

Hi Mr. Ranga,

Thank you for the clarification that we are working with **SAP Business One on SQL Server** (not SAP HANA).

To proceed with extracting data for analytics, please provide the following:

1. **SQL Server database access:**
  - o Server name or IP address
  - o Database name (SAP Business One company database)
  - o Port number (usually 1433)
  - o SQL login credentials with **read-only (SELECT)** permissions on the database
2. **Network access** to allow connections from the analytics application to the SQL Server instance.

Since we will be connecting directly to the SQL database for data extraction, no SAP GUI, developer, or superuser roles are needed.

Please coordinate with your IT or database administration team to provide these details and access.

Thank you,  
Gloria johannes
